

## 6 Fuel Pipe Toppers - Updated 2/2/18

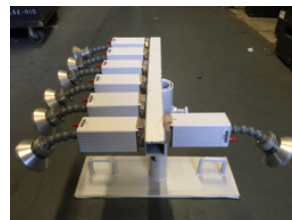

In addition to the 6 threaded points, we are now okay to add more fixtures to the bottom, or the backside of the square stock using the Fuel's magnets. For the safety of all, plus the equipment, please make sure to follow these directions.

- Raise the tree prior to attaching the extra Fuels. Please use a ladder for installing these.
- Please do not attach Fuels to the top of the square stock. The flexible yokes do not bend far enough to point downward and could be damaged if attempted.
- Always remove the Fuels before lowering the trees. There is the chance that one could fall and cause damage.

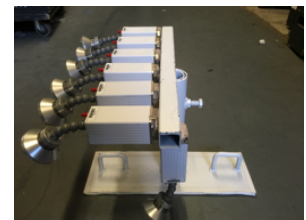

While on the ground, line up the center of the fixture on one of the threaded bolts. Punch through the velvet in the center and screw the fixture on. Please do not remove the whole velvet pad as they will still be needed for down hanging from ceilings.

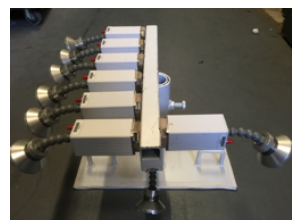

Start installing from the middle and work your way out. Remember to finish with the IR sensor down.

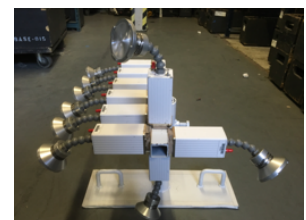

Backside is okay ✓

Bottom hung - okay ✓

Back and bottom ✓

Top hung is a NO ✗

Once all the fixtures required are installed, place the topper on your pipe and tighten the bolts. Much like a pipe coupler.

Dress with velvet over the top like you would with any other pipe and base.
